

# Final Project Starter Code Design

You will build on this.  
The starter code contains a working command system. You just need to code the behaviors.  
How those behaviors work will be dependant on the rest of your design!

Important (maybe not obvious) design questions to answer:

1. Where are your locations created?
2. Where are they stored?

3. Where are your entities created?
4. Where are they stored?

4. Where are your Items created?
5. Where are they stored?

6. HOW are each of them stored?
7. How can you access each of them?

Many of these can not be (intelligently) answered until you start thinking about how you have to access the data, and where you will need to access it from.
